

DIGITAL DESIGN

Naval Undersea Warfare Center, Division Newport

An ongoing issue in computer hardware design is the design of floating point hardware which is both standard compliant (IEEE-754) and efficient in both size and speed while delivering the correct precision in results.

These digital design prototypes were tested against the present Xilinx and Altera floating-point FPGA designs and performed **30%-50%** better in size and/or speed as compared to commercial IEEE-754 hardware.

Potential Commercial Uses

- Design applies to any floating point hardware
- Implementation into standard floating point units
- Results scale up with hardware and fabrication design improvements

INITIAL PROTOTYPE AVAILABLE

PATENT NUMBER(S):
14/535384, 17/575703,
and 17/123194
